AutoCAD Crack + Full Version Download

AutoCAD is often thought of as an easy-to-learn drafting package, but it is very versatile. Its extensive libraries and communities are widely recognized as the best in the industry, providing support for a wide variety of different applications. The following is an overview of what AutoCAD does, the industry that it serves, and how it is used. What AutoCAD Does There are several different ways to draw a line or curve in AutoCAD, and they can be divided into two broad categories, axis-based and location-based. The drawing process This section describes the steps involved in drawing a line or curve in AutoCAD. Rasterize a line or curve Rasterize a line or curve enables you to create lines and curves as images in the drawing area. These rasterized objects can be saved and reused later, and they can be transformed or mirrored just like any other image in the drawing. Rasterizing a line or curve is one of the most basic drawing operations. Start the line or curve A line or curve can be initiated from a point, intersection, or endpoint. Narrow the line or curve To narrow a line or curve, select a subfeature on the feature line or curve. Reverse a line or curve To reverse a line or curve, select a subfeature on the feature line or curve. The line or curve is then rotated in the opposite direction. The object snap settings These controls are used to change the default location of the snap feature. For example, if the snap feature is enabled for the horizontal snap feature, it will be activated when the drawing view is held down over the drawing area, as opposed to when the pointer is moved. Track edit When the user changes the drawing area settings in AutoCAD, the new settings are automatically entered into the workspace. The current drawing view is placed at the current drawing area settings. The user can continue to draw with the current drawing view even after changing the drawing area settings. Horizontal edge When the user changes the drawing area settings in AutoCAD, the new settings are automatically entered into the workspace. The current drawing view is placed at the current drawing area settings. Specify the line to track The user can edit a portion of the drawing and then specify which feature line (axis or location) to place the end
