If you use the `convert=l` parameter to specify a different `clcdf` DB to store statistics in, the `mapfile.pbf` must be in the same directory as `osmconvert.out`. If the output directory is not specified, it is set as `osmconvert_tempfile`. This command will create the files `/osmconvert_tempfile.pbf`, `/osmconvert_tempfile*` in `,` and the final output file `/.osm`. is either `.osm` or `.osm`. The files will be numbered like `osmconvert_tempfile*_key`. The part of the file name is always the same as the `.`. The `out-statistics` option generates some statistics of the conversion process. They are stored in the `/osmconvert_outkey.osm`-files, where the `is` specified with the `--out-statistics` option. If you do not want to use the statistics, specify the `--out-statistics` parameter with `-`. The following software is needed to use this utility

Windows - Any version. Python and Cython installed. The `fbl` map files download and convert tool is distributed as a single file (`exe`) containing the Cython compiler (`python setup.py cython`) and the Python code for the utility (`setup.py`). Currently `osmconvert` supports PBF files with the following standard granularity: `1K=100:1000`
`5K=100:10000` `10K=100:100000` `25K=100:250000`
`50K=100:500000` `100K=100:100000`

If you want to write out the objects in a different way, you have the option to export the data to a different file. For example, if you want to keep the `o5m` extension and rename files the original extension, you can copy the map files from a `region1-format` file and change their

extension before exporting them. The text files which are required by the 'osmconvert' function are generated by osmconvert itself. The function writes a header Changes: followed by the number of ways, relations and nodes, and the total size of the new file to the standard output stream. osmconvert is sorted by the objects (counted from left to right, top to bottom) in the header. The actual position in the file of any object is given by its original position in the original file. If this position is before the change point, i.e. the opening of the file in the header line, the location is read from the header of the original file. If the location is after the change point, it is read from the file after the change. The order is switched (i.e. top to bottom and left to right) if there is no change. With the help of osmconvert it is also possible to filter the unchanged objects in the input file. osmconvert will not process any unchanged way or relation. A way or relation is unchanged when it is still in the original file but no other object with the same id is added to the new file. osmconvert offers two commands: 'filter unchanged ways' and 'filter unchanged relations'. If you want to have the converter send all currently downloaded files to a file of choice, use the --dump-files-to-file-of-choice command line. Note that the converter updates its output files on the fly, so if you only want a static copy of the output files, you can add the --compile command line option. 5ec8ef588b
